MerchantLens

Tell the story once.
Carry every useful detail forward.

A merchant support teammate for clearer cases
and reviewed handoffs

Gowtham Ramachandra

Solo participant / Track 3: Autonomous AI Teammates

Working prototype Public source

Problem: unclear evidence and repeated explanations

“The customer paid, but my Soundbox stayed silent.”

Three separate questions

Did the app record the payment?
Was bank settlement checked?
Did the device announce it?

Context gets fragmented

Earlier checks and support contacts may not travel with the case. The next reviewer needs the unresolved question and its source.

A screenshot or a silent device cannot establish financial loss.

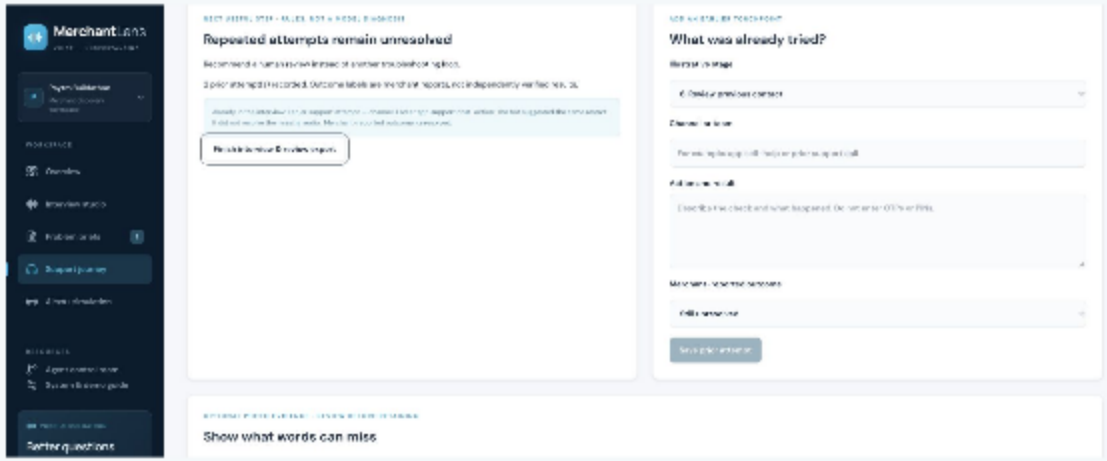

Design hypothesis: better continuity reduces repeated clarification. Merchant impact remains to be measured.

Solution: a case that keeps its context

Voice or text intake, optional photos and reviewed next steps

Eight optional support stages

1 Clarify the report
2 Review payment evidence
3 Add a supporting photo
4 Review visual findings
5 Record self-service checks
6 Capture previous contact
7 Prepare human handoff
8 Follow up on the outcome

Human help stays available immediately.
Every stage can be skipped.

Technology and agent execution

Interface and voice

React, TypeScript and Vinext
Gemini transcription and speech
English, Hindi, Kannada, Hinglish

Bounded agent workflow

Extractor proposes source-linked claims.
Critic challenges interpretation.
Planner selects the next question.

Code controls authority

Exact quote and source checks
Up to 4 model calls and 3 local tools
One repair and a 55-second deadline

Runtime and review

Node on Google Cloud Run
Browser-local cases in public demo
Edits invalidate both export approvals

67 automated tests pass. Seven guided probes are separate from live-model accuracy testing.

USP: useful evidence survives the handoff

Traceable observations

Each claim links to received words.
Unknowns remain explicit.
Corrections supersede earlier claims.

Pictures with merchant control

Cover details before external analysis.
Review the provisional note.
Retain no raw image in the case.

Prior attempts stay attached

Record the previous action and result.
Recommend review after repeated failure.
Carry history into the internal brief.

Different audiences, fresh approval

Internal brief includes reviewed history.
Public export omits image notes.
Changes invalidate previous approvals.

Impact and pilot measurement

Primary goal: less merchant effort, with useful human handoffs

Merchant outcomes

Fewer repeated explanations
Less time spent on the case
Clear status and remaining unknowns

Operations outcomes

Reviewer handling time
Handoff completeness
Incorrect routing and recontacts

Proposed pilot: 10 consenting merchants with operations reviewers

Compare matched cases with the existing flow. Record voice failures, corrections, cost and whether improvement lasts.

Business model and integration plan

Proposed internal capability for Paytm merchant operations

Value and cost model

Value comes from saved reviewer time and lower repeat-contact effort. Costs include inference, hosting, maintenance and human review.

Pilot before system execution

First validate handoff usefulness. Then add authorized read-only records. Add approved ticket creation with idempotency and durable receipts.

Illustrative monthly capacity value, not measured savings

10,000 cases × 2 minutes × ₹8/minute = ₹1.6 lakh gross
Less ₹30,000 assumed AI/hosting cost = ₹1.3 lakh before other costs
